                                                             The family Pasteurellaceae encompasses several pathogens that infect a wide variety of animals. The present invention relates to virulence genes from Pasteurellaceae. The present sequence is one such virulence gene. The present sequence may be mutated in order to produce an inactive gene. The inactive virulence gene may in turn be used to produce a vaccine, which is useful for treating bacterial infections such as septicemias, bronchopneumonias, rhinitis and wound infections
                                                                                                                                                                                                                                                                                                            483

The present invention describes a gram-negative bacteria comprising a mutation in a gene, where the mutation results in decreased activity of a gene product encoded by the mutated gene. Also described is a method for producing a gram-negative bacteria mutant or an attenuated Pasteurellaceae bacteria. The mutated genes have antibacterial activity Pasteurellaceae bacteria. The gram-negative bacterial activity Pasteurellaceae bacteria can be used as vaccines in the fields of human medicine or veterinary medicine, and for identifying new antibacterial agents that target the virulence genes and their products. ABQ83458 to exemplification of the present invention. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for identifying their products.

The present invention relates to virulence genes from Pasteurellaceae. The present sequence is one such virulence gene. The present sequence may be mutated in order to produce an inactive gene. The inactive virulence gene may in turn be used to produce a vaccine,

The present invention describes a gram-negative bacteria comprising a mutation in a gene, where the mutation results in decreased activity of a gene product encoded by the mutated gene. Also described is a method for product encoded by the mutated gene. Also described is a method for Pasteurellaceae bacteria. The mutated genes have antibacterial activity and can be used in vaccines. The gram-negative bacteria or the attenuated medicine or veterinary medicine, and for identifying new antibacterial aggents that target the virulence genes and their products. Abg033458 to exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New mutant gram-negative bacteria, useful as vaccines and for identifying
new anti-bacterial agents that target virulence genes and their products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ThrLysAlaMetGluMetValAlaAlaSerLysMetArgLygThrGlnGluArgMetSer 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          160
                                                                                                                             The present invention describes a gram-negative bacteria comprising a mutation in a gene, where the mutation results in decreased activity of a gene product encoded by the mutated gene. Also described is a method for producting a gram-negative bacteria mutant or an attenuated pasteurellaceae bacteria. The mutated genes have antibacterial activity and can be used in vaccines. The gram-negative bacteria or the attenuated sesteurellaceae bacteria can be used for identifying new antibacterial agents that target the virulence genes and that recompanies. Also says and ABPS4473 to ABPS451 represents sequences used in the exemplification of the present invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               420
                                                                   New mutant gram-negative bacteria, useful as vaccines and for identifying
new anti-bacterial agents that target virulence genes and their products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species, to study polymorphisms, for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/dentification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  654
recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to new Proteus mirabilis polypeptides and polynucleotides. The invention also relates to antibodies against the polypeptides, a method of polypeptides, a method of generating vaccines for immunising an individual against P. mirabilis, a method for evaluating a compound for the ability to bind P. mirabilis, polypeptide and method for screening test compounds for anti-bacterial activity. The polypeptides and polynucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial diseases, as components of antibacterial values or as bio-control agents for plants. This sequence represents a Proteus mirabilis polynucleotide of the invention.

```
The present invention describes a purified or isolated nucleic acid sequence (I) consisting essentially of one of the 93 nucleotide sequences given in AAH81202 to AAH81294, where expression of the mucleic acid in a microorganism is capable of inhibiting proliferation of a microorganism.

(I) have antibacterial and antibiotic activities, and can be used in gene the mapy. Expression of (I) in a microorganism inhibites proliferation of the microorganism, and the manufactured antibiotic is useful for reducing the microorganism, and the manufactured antibiotic is useful for reducing the microorganism in a subject, specification can be used as antisense inhibit bacterial growth or proliferation can be used as antisense therapeutics for killing bacteria. In addition to therapeutic caids that inhibit bacterial growth or proliferation can be used as antisense required for proliferation can be used as diagnostic tools. For example, nucleic acid sequences and sequences complementary to proliferation-required sequences that are specific for particular species of microorganisms can be used as probes to identify particular species of microorganisms can be used as probes to identify particular microorganism species in clinical species in AAH81295 to AAH81487 encode the Escherichia coli proteins allowant and a particular and AAH81491 represent colinical allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and allowants and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AsnGluLeuGlnLeuValTyrAsnLysAlaArgGlnAlaSerIleThrAsnGluLeuAsn 280
The invention describes a new isolated nucleic acid encoding a Klebsiel pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This sequence encodes a Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                            1 MetAlaGlyAlaLysGluileArgThrLysileAlaSerValLysSerThrGlnLysIle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and the polymucleotides encoding them. The sequences are useful in diagnosis and the pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant or production of P. aeruginosa derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of infection, and in detection of P. aeruginosa sequences or other sequences of Pably 567 represent P. aeruginosa polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed contains the printed of the invention of the argument of the printed of the invention of the argument of the invention of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argument of the argum

Pseudomonas aeruginosa polynucleotide #2405.

```
Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                 Disclosure; SEQ ID NO 2405; 455pp; English

Bush

Deloughery C,

98US-0094190P.

99US-00252991 98US-0074788P The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therepoly of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of feetive antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for antibacterial drugs, components for diagnosis and/or treatment of P. aeruginosa caused infection, and in detection of P. aeruginosa sequences or other sequences of percent of the sequence and for this patent did not form part of the invention. Note: The sequence data for this patent did not form part of the printed secdata.uspto.gov/sequence.html

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
the gut. The DNA is derived from mally hatched first instar larvae
the gut. The DNA is derived from mixed sexes of larvae. The BAC
University, College Station, Texas 77843-2123, USA using a HindIII
Seg primer: M13 For
Class: BAC ends.

Submitted (18-NOV-2003) Genoscope - Centre National de Sequencage :

Par 191 91006 ENRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr

Wheb : www.genoscope.cns.fr)

The sequences are based on single pass reads.

Life Technologies (a division of Invitrogen) members carried out full-length libratires construction : Temple G.

Schackter V. Weissenbach J. Salanoubat M. Gruaud C.,

No., Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C.,

Schackter V. Weissenbach J., Salanoubat M.

Minotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences) : 5 prime and 3 prime are assembled with Phrap.

This clone is from an A. gambiae BAC library (ND-TAW) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from mixedororganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M Universty BAC Center
